PRICES RECEIVED BY TEXAS FARMERS AND PRICE INDEX NUMBERS, 1910-58

J. A. Kincannon and George B. Strong\*

Index numbers of Texas agricultural commodity prices and the actual monthly and annual average price for all principal Texas agricultural commodities are presented in this publication. U. S. indices of prices paid, prices received and parity ratios also are shown.

These indices and prices, with the exception of a few commodities that became commercially important during and after World War II, are shown for 1910-58.

These data are intended to serve as a composite series of prices and index numbers which are useful in almost all agricultural research.

The series of prices and indices are designed to afford the researcher data for any appropriately desired base period index and weighted prices. These data will obviate the necessity of having to search through many publications and adjusting these data to comparable and relevant bases.

The bases and methods of computation for the index numbers and price series are shown in TAES Bulletin 946, "Factors Affecting Texas Farm Commodity Prices and Index Computation Methods, 1910-58."

PRICES RECEIVED BY TEXAS FARMERS

The series of prices received by Texas farmers presented in this publication provide much of the basic data needed to study price relationships, including important seasonal variations. These prices related to the average price received by producers for products at the point of first sale. Points of first sale range from sales at retail or from sales on a graded, packed and delivered basis to bulk sales at the farm. The average price concept is one which, if multiplied by the total quantity of the commodity sold, would equal the total dollars received by all producers for a commodity.

Monthly Prices

Prices received are collected from various sources but mainly from voluntary reporters by means of mailed questionnaires. In general, price reporters are country merchants, dealers in farm produce at local shipping points, operators of country mills and elevators, cotton ginnermen and warehousemen, managers of auction markets and livestock commission firms, wool and mohair warehousemen, managers of milk marketing orders and receiving stations, hatchery managers and local bankers. A few farmers, and other persons with a knowledge of prices of farm products, also are on the list.

---

\*Respectively, assistant professor, Department of Agricultural Economics and Sociology, Texas Agricultural Experiment Station, College Station, Texas; and agricultural statistician, Agricultural Estimates Division, Agricultural Marketing Service, U. S. Department of Agriculture, Austin, Texas.

Prices reported by correspondents are tabulated and averaged by price reporting districts, of which Texas has 10. District averages are weighted by sales or production estimates to reflect the importance of each district relative to the State.

Prices published for Texas and the United States are estimates of the average price received for all grades marketed. Average prices of this type are useful in computing value of farm production and cash farm income, measuring price trends, for other types of economic analysis and for use in computing price index numbers and parity prices.

Originally prices received for all items related to sales at midmonth. As additional information became available, prices for a number of items have been refined to reflect monthly averages. For example, weekly broiler prices are combined into a monthly average price. Monthly prices received for commercial vegetables sold for fresh market also are averages for the first and second half of the month combined on the basis of sales in each period. Prices for milk sold at wholesale apply to all milk sold during the month.

#### Seasonal and Annual Average Prices

In addition to average monthly prices, annual averages are included in this publication. For livestock and livestock products, annual averages are for the calendar year with monthly prices weighted by estimated quantities marketed each month. For crops, the annual price, or season average, is the weighted average of monthly prices for the crop season. The marketing season for each crop is shown in a footnote at the bottom of the respective table.

Only annual price averages are shown for peaches, mohair and pecans. Monthly peach prices are available for 1948 to date and were used in developing the fruit price index. A series of monthly mohair prices was developed for use in preparing the wool and mohair price index although it is not published. Beginning in 1958, a monthly series of mohair prices was started. Only season average prices have been developed for pecans.

#### ACKNOWLEDGMENTS

Basic price data reported to the Crop and Livestock Reporting Service by businessmen and well-informed farmers make a publication of this nature possible. Prices received by Texas farmers for commodities sold and prices paid by them for items purchased are reported voluntarily, without financial remuneration, by cooperating reporters.

This publication represents efforts of many persons in the process of preparing the material for publication. We acknowledge the assistance of the clerical staffs of the Agricultural Estimates Division, Agricultural Marketing Service, USDA, Austin, Texas, and the Department of Agricultural Economics and Sociology, Texas A&M College System.

Appreciation is expressed especially to B. R. Stauber, Division of Agricultural Estimates, USDA, Washington, D. C., for his counsel, especially in revising the Prices Received Index. Much credit is due R. L. Smith, Jr., Data Processing Center, Texas A&M College System, and his employees for assistance in computing indexes of prices received and indexes of seasonal variations contained in this publication.
